PRESS RELEASE 08 / 2023

SECURER respiratory mask with light disinfection at the world's leading trade fair MEDICA 2023

The SECURER respiratory mask is the first particularly lightweight electronic respiratory protection that not only filters all currently known and future viruses with the help of an integrated UVC LED light disinfection, but kills them 100%. In the future, the innovation, which was developed in three years of research work, will also demonstrably clean 99.999% of bacteria and other harmful air particles from the air we breathe.

In the BESTFORM 2023 innovation competition, the "SECURER" prevailed against around 50 competitors and secured first place, endowed with 10,000 euros, from the state of Saxony-Anhalt.

When using the transparent mask, it barely touches the face, is reusable and the technology is rechargeable. The clean air is supplied by means of small fans. The exhaled air is cleaned and extracted again. Difficult breathing against a mask material - as with well-known medical and FFP2 masks - is no longer necessary and the user's facial expressions are fully visible.

"At this year's largest medical technology trade fair MEDICA 2023 with around 4,500 exhibitors from 66 countries, we would like to present our high-tech world innovation SECURER - which we call the smartphone of respiratory protection technology - to more than 80,000 trade visitors. Through these international trade visitors, we want to sensitise demanding professions in the healthcare sector, such as doctors, pharmacists as well as nurses worldwide, to our novelty and reach them as target groups, since they are basically exposed to an increased virus and bacteria load and are open to our high-tech solution," says Arno Lauhöfer, Managing Director of SecureAir GmbH.
